Anniversary of the discovery of the Higgs boson

- <https://indico.cern.ch/event/1135177/>
- Where: CERN

- On 4 July 2012, a packed CERN Auditorium, joined by physicists in Melbourne on the eve of ICHEP2012, along with a global webcast audience, learned that the long-awaited Brout-Englert-Higgs mechanism had finally been revealed by the [ATLAS](#) and [CMS](#) experiments at CERN. The Spokespersons of both collaborations presented compelling evidence for the [Higgs boson](#).
- The following ten years have seen impressive advances in our understanding of the Higgs boson's properties, and there is much more to be learned.
- This anniversary symposium celebrates 10 years of Higgs boson physics, takes a look at the latest results, and considers future prospects.
- The full symposium will be [webcast in English](#) with live captions.
- The morning session will also be [webcast in French](#).
